

In some cases, in-plant buildings require a temporary opening to accommodate for moving equipment, materials, etc. Panel Built can accomplish this through roll-up doors, framed openings, or removable paneling.

Our removable panels are a great option for companies who will be using the opening less frequently. This option helps provide a more consistent R-Value & STC rating through the building envelope.

## Removable Panels

REMOVABLE PANEL ATTACHMENTS

Our removable walls are formed from the same 3" thick panel as the surrounding building. 3"X3"X3/16" steel tubing creates a framed opening (size adjustable) in the enclosure. Aluminum channel caps the removable panel sides and is attached to the steel tubing via self-drilling screws. Panels can be removed by unfastening self-drilling screws from framed opening and detaching the paneling from the wall system. For larger opening, panels can be made to be removed individually.
